(Developmental Cell 24, 336–338; February 25, 2013)

Figure 1 and some of the related text did not adequately convey the complexities of membrane and junctional dynamics during cytokinesis. A low level of E-cadherin remains in the division plane throughout furrowing. The sustained colocalization of the plasma membranes of the furrowing cell and its neighbors leaves open the question of whether and in what contexts epithelial integrity is compromised during the division of its constituent cells. The Preview has been updated online to reflect these considerations.
